Project 2: Portal

I made my portal using VSCode and Bootstrap, only using CSS to change the background color a little bit. I used 3 Bootstrap templates for the formatting: containers, nav-tabs, and accordions. The accordion is especially helpful for displaying all the zylab work in each module.

Some things that might not be initially visible is how the site accesses some of the projects. For the projects that have URL's, the portal will just open the associated URL in a new tab. For offline projects, it will refer to some folders that are also present with it in the lamp server folder.

In terms of styling, I didn't do much. To be honest, I don't know what I'd do. I don't have much of a creative vision for that part since the site seems to do its job just fine. I don't doubt that I might lose points for it though.

The only thing I wish I gave more time to was testing the site on different browsers. Since I used Bootstrap templates, I think it's fine, but I'm unsure.
